(54) TELEVISION BROADCAST SYSTEM

(57)Abstract:

PURPOSE: To provide selectivity to the compression and the multiplexing system of a video image to be broadcast.

CONSTITUTION: A reception section 108 of a receiver 102 receives control information as to a program channel on which plural video information sets are multiplexed and a program channel selected by a viewer. A reception control section 114 commands output of video information sets are multiplexed and a program channel selected by a signal demultiplex section 109. Moreover, a decoding program included in the control information is fed to a decoding section 110. The decoding section 110 executes the sent decoding program, decodes the video information outputted from the signal demultiplex section 109 and displays it on a display section 111. Thus, a transmitter 101 designates the compression system or the multiplex system of the video image to be broadcast to the receiver by the control information, then the video information is broadcast by an optional compression system or multiplex system.
